Moore’s Law

intel

Moore’s Law: The number of transistors on microchips doubles every two years
Moore’s law describes the empirical regularity that the number of transistors on integrated circuits doubles approximately every two years.
This advancement is important for other aspects of technological progress in computing – such as processing speed or the price of computers.

Early EDA System

1966, IBM360/37 mainframe-powered CAD at Fairchild

Mask layout drawing hand digitizing system at Intel

Software Revolution

TCPL: The C Programming Language

UNIX running on PDP-11

Contribution

```
; This program displays "Hello, World!" in a windows messagebox and then quits.
;
; Written by Stewart Moss - May 2006
;
; Assemble using TASM 5.0 and TLINK32
;
; The output EXE is standard 4096 bytes long.
; It is possible to produce really small windows PE exe files, but that
; is outside of the scope of this demo.
